

Full Spectrum Oils

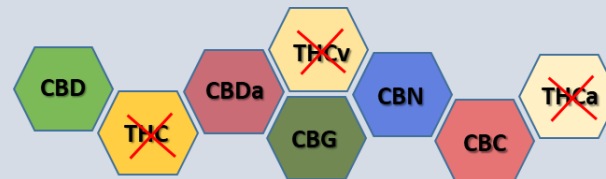

Full Spectrum CBD contains every cannabinoid present in the hemp or cannabis plant. Full spectrum products contains small amounts of THC (0.2%) which could cause one to fail a drug test*

The Entourage Effect

In 1999 Dr. Mechoulam found more than 480 natural components within the cannabis plant, of which 66 have been classified as cannabinoids. All these components of the hemp/cannabis plant has therapeutic effect, more than any single compound alone. He called it The Entourage Effect. Hemp offer its most profound benefit as a whole plant, if we let the entourage effect flower.

Broad Spectrum Oils

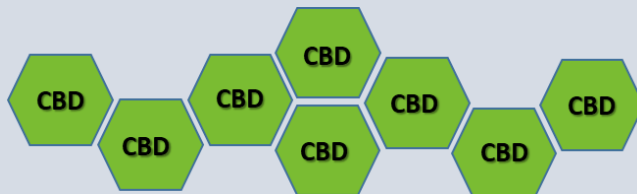

Broad spectrum CBD is an extract from the cannabis/hemp plant that contains all compounds found naturally occurring in the plant. There is ONE absolute MUST in broad spectrum extracts is they must be THC free.

Today's drug tests only tests if THC is present - Not the actual amount of THC.

Oils made with ISOLATE

Isolate CBD is when the cannabinoid CBD is separated from all the other compounds present in the plant. Other compounds offer some benefits which will not be present in a CBD Isolate product.
